1.2-17

(a)

To draw 4 cards with the same face value, there's 13 possibilities, then draw one from the rest of cards, there's $52 - 4 = 48$ possibilities (By definition, it's impossible to have same value with the previous 4 cards.), Hence, the probability is:

$$\frac{13 \times 48}{\binom{52}{4}} = \frac{1}{4165}$$
